Dan Phylbert

Software Engineer | Accessibility and digital media | Milton Keynes, UK | danphylbert@gmail.com | 07423371686
www.danphylbert.dev | github.com/kes-phyl | linkedin.com/in/dan-phylbert-704947183

Profile

Software engineer with experience developing sign-language accessibility products and connected-TV applications. Specializes in React, TypeScript, and platform integrations, with responsibility for interface development, analytics, and delivery across engineering, product, and QA teams. MSc Computer Science, Coventry University.

Technical expertise

Frontend: React, Next.js, React Native, Lightning JS, TypeScript, JavaScript, HTML and CSS.
Integration and quality: REST APIs, Node.js, Jest, Git, analytics instrumentation, accessibility and device-specific debugging.

Professional experience

FX Digital Midweight Software Developer
London | Joined November 2024

- Delivered BritBox WebTV and Kepler application features, working with product, QA and platform engineers across connected-TV environments.
- Developed getRowAndColumn in Kepler to derive content-card positions from card and parent references for analytics payloads; the approach was subsequently reused across projects.
- Took ownership of a large analytics workstream. Manager feedback recognized independent research, QA/Product collaboration, persistence, and clean, well-structured code.
- Delivered complex interface work including the Premier Show Page; contributed subscription flows, platform integrations and device-specific fixes.
- Supported onboarding of two engineers and shared technical context through reviews, documentation and troubleshooting.

OASIS Group Software Engineer
London | March 2024-November 2024

- Developed customer-facing applications using React, TypeScript, and Node.js, including reusable interface patterns and REST API integrations.
- Worked with designers and engineering colleagues on accessible interfaces, performance, testing, and implementation consistency.
- Supported code quality through reviews and technical discussions.

Signapse AI Frontend Engineer
Cambridge | December 2022-March 2024

- Led frontend development of sign-language accessibility interfaces, including the website signer overlay, video translation platform, and CVG announcement portal.
- Worked with engineering and commercial colleagues on review, stakeholder feedback, and preparation for customer delivery.

Selected engineering contributions

Website signer overlay — Signapse

Developed API integration, BSL parameter support, and playing-paragraph identification for an overlay connecting selected website text to sign-language video. Addressed mobile interaction behavior to support a draggable overlay alongside browser gestures.

Authored changes are documented in signer-overlay PRs #12, #22, and #26, merged February-July 2023. A client-domain screenshot and Signapse case study document the wider product at JFK; contribution records and public adoption establish different parts of the delivery trail.

CVG announcement portal — Signapse

Implemented flight-fetch functionality, announcement components, and a B10 gate update. Provided development access for stakeholder review. PRs #2, #3, and #8 were merged January-February 2024; stakeholder and integration records document progression towards in-person testing.

Video translation platform: Signapse

Contributed homepage, forms, feedback, mobile detection, and request handling. Authored sign-up UI PRs #2, #6, and #10, which were merged in August- September 2023. Contemporaneous feedback acknowledged the work and assessed launch readiness.

TV platform integrations — FX Digital

Adapted Redfast subscription prompts for Lightning using API responses and native components. Contributed in-app purchase and subscription-service functionality, including investigation of environment and platform blockers. Worked on Kepler media controls and Alexa voice-command support.

Implemented ATI / Piano analytics for connected-TV applications. Developed getRowAndColumn using card and parent references to include row and column positions in event payloads, allowing interactions to be understood in their on-screen context. Established the approach in Kepler; it was subsequently reused across projects. Production event captures support the analytics implementation.

Teaching experience

West African Union University(WAUU) — Lecturer II
Porto Novo, Republic of Benin | January-September 2019

- Lectured CS 213: Survey of Programming Languages to over 60 students at the 200 level, covering programming paradigms, language implementation and architecture, and evaluation criteria across JavaScript, PHP, Java, C, and Python.
- Helped students complete their first programming projects and assessed their understanding through the course examination.
- A former student, now a frontend developer, credited my explanations with making complex technical topics easier to understand.
- The university appointed me Exams and Records Officer in recognition of my technical capability.

Education

MSc Computer Science | Coventry University | 2022

Professional development

Responsive Web Design | freeCodeCamp | January 2022
CSS Essential Training | LinkedIn Learning | May 2022
JavaScript Essential Training | LinkedIn Learning | June 2022
JavaScript Classes | LinkedIn Learning | December 2022

Public acknowledgment and interests

- Signapse publicly acknowledged MSc graduation and identified Dan as part of its video translation and real-time applications team.
- Sign-language learning: seven years of American Sign Language and two years of British Sign Language.

Forthcoming opportunity

Bauer Media Outdoor | Software engineering offer received October 2026

Offered GBP 60,000 base salary plus 7.5% bonus and benefits. Start date to be agreed, pending immigration outcome and confirmation of permission to work. Based in Milton Keynes, with plans to work in London and continue developing technology products in the UK.
